COMPUTERS

IBC IS THE ONE COMPUTER YOU NEED WHEN YOU NEED MORE THAN ONE.

If you want a computer to help you run your business, then you need a multiuser computer. Not a PC. It's that simple.

A PC is a personal computer, not a business computer. That's because PC's are single user computers with single user software. They're good for one person — but not good enough for a whole company. Even if the company is only two people.

Every computerized business has someone entering information someplace while someone else is looking up information somewhere else. That's two users. And every business has more than two users who need access to the computer. That's a multiuser computer environment.

The idea of multiuser computers is not new. They've been around longer than PCs. Companies like IBM, DEC, and HP have been selling multiuser business computers for years. So has IBC.

Recently the PC has gotten all the attention. It has a

low price and can do a lot of new things for your business. But as soon as you buy the first one, you'll realize that you really need more. But buying more PCs is not the answer. What your business needs is a true multiuser computer.

The MultiStar 4 is IBC's lowest priced computer, yet it supports up to four users at a price comparable with single user PCs. Should the needs of your business ever go beyond the four user capacity of the MultiStar 4, your software investment can easily be transferred to IBC's Ensign. The Ensign costs a little more than the MultiStar 4, but can be upgraded to support up to 100 users. The MultiStar 4 definitely makes more business sense than a single user PC that can never be anything more than a single user PC.

If you want a good business computer, look at what IBM, DEC, HP, or anyone else has to offer. But if you want that business computer at a great price, then look at what IBC has to offer. We've been building **low cost** multiuser business computers since 1979. And **that's** longer than anybody else.
